Art Unit: 2625

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-2, 4-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orava et al. (United States Patent 5,812,191) hereinafter referenced as Orava, further in view of Yamamoto et al. (United States Patent 7,098,950), hereinafter referenced as Yamamoto.
- 3. **Regarding claim 1**, Orava discloses a semiconductor high-energy radiation imaging device. In addition, Orava discloses an image pickup apparatus in which a pixel area, including a plurality of pixels each having a photoelectric conversion portion 20 and a common output portion 62 configured to sequentially amplify and output signals from the plurality of pixels included in the pixel area, is formed on a single semiconductor substrate, as disclosed in column 5, lines 39-50, column 16, lines 57-67 and exhibited in figure 4.
- 4. Regarding the common output portion, Orava discloses, in column 2 lines 27-35, that the semiconductor imaging device has an array of pixel cells including a semiconductor detector substrate and a semiconductor read out substrate, which are both integral to the semiconductor substrate, wherein:
- 5. The semiconductor readout substrate includes an array of individually addressable pixel circuits, each of which is connected to a corresponding pixel detector

Art Unit: 2625

cell to form a pixel cell, which reads on claimed, "common output portion for sequentially amplifying and outputting signals from the plurality of pixels included in said pixel area."

- 6. However Orava fails to explicitly discloses that the apparatus comprises:
- 7. a power supply unit configured to effect power supply control of the common output portion independently of control of the power supply to the pixel area; and
- 8. a control circuit configured to effect control to supply no power to the common output portion in a predetermined period after starting photo-charge accumulation in the photoelectric conversion portion and to supply power to the common output portion before the end of a photo-charge accumulation period in the photoelectric conversion portion.
- 9. However it would have been obvious to one of ordinary skill in the art at the time of the invention to include:
- 10. a power supply unit configured to effect power supply control of the common output portion independently of control of the power supply to the pixel area; and
- 11. a control circuit configured to effect control to supply no power to the common output portion in a predetermined period after starting photo-charge accumulation in the photoelectric conversion portion and to supply power to the common output portion before the end of a photo-charge accumulation period in the photoelectric conversion portion, as taught by Yamamoto.
- 12. In a similar field of endeavor, Yamamotot discloses an image sensor with stabilized black level and low power consumption. In addition Yamamoto discloses that the image sensor apparatus includes,

Art Unit: 2625

- 13. However Orava fails to explicitly discloses that the apparatus comprises:
- 14. a power supply unit 21 configured to effect power supply control of the common output portion independently of control of the power supply to the pixel area, as disclosed in column 2, lines 32-46, column 7, lines 49-60 and exhibited in figure 11; and
- 15. a control circuit 22 configured to effect control to supply no power to the common output portion in a predetermined period after starting photo-charge accumulation in the photoelectric conversion portion and to supply power to the common output portion before the end of a photo-charge accumulation period in the photoelectric conversion portion as disclosed in column 8, lines 44-54, and exhibited in figure 11.
- 16. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to include those modifications to the invention of Orava for the purpose of reducing power consumption.
- 17. **Regarding claim 2**, Orava and Yamamoto, the combination discloses everything claimed as applied above (see claim 1), in addition, Orava fails to explicitly disclose that the apparatus includes control circuitry which variably controls the period during which no power is supplied to the common output portion. However Yakamoto discloses the same in column 8, lines 44-54, and exhibited in figure 11.
- 18. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to include this modification to the invention of Orava for the purpose of reducing power consumption.
- 19. **Regarding claim 4,** Orava and Yamamoto, the combination discloses everything claimed as applied above (see claim 1). In addition Orava discloses a semiconductor

Art Unit: 2625

imaging device. Regarding the common output portion, Orava discloses, in column 2 lines 27-35, that the semiconductor imaging device has an array of pixel cells including a semiconductor detector substrate and a semiconductor read out substrate, which are both integral to the semiconductor substrate, wherein:

- 20. The semiconductor readout substrate includes an array of individually addressable pixel circuits, each of which is connected to a corresponding pixel detector cell to form a pixel cell, which reads on claimed, "common output portion for sequentially amplifying and outputting signals from the plurality of pixels included in said pixel area."
- 21. In addition Yamamoto discloses
- 22. a power supply unit 21 configured to supply a first power level (a first "reference voltage") and a second level lower than the first power level (0 or another "reference voltage") to the common output portion, as disclosed in column 2, lines 32-46, column 7, lines 49-60 and exhibited in figure 11
- 23. a control circuit 22 configured to effect control to supply power of the second power level to the common output portion in a predetermined period after starting photocharge accumulation in the photoelectric conversion portion and supply the first power level to the common output portion before the end of a photo-charge accumulation period in the photoelectric conversion portion, as disclosed in column 8, lines 44-54, and exhibited in figures 11 and 12.
- 24. **Regarding claim 5**, Orava and Yamamoto, the combination discloses everything claimed as applied above (see claim 4), in addition, Orava fails to explicitly disclose that the apparatus includes control circuitry which variably controls the period during which

Art Unit: 2625

the second power level is supplied to the common output portion. However Yakamoto discloses the same in column 8, lines 44-54, and exhibited in figure 11.

- 25. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to include this modification to the invention of Orava for the purpose of reducing power consumption.
- Claims 3 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orava et al. (United States Patent 5,812,191) hereinafter referenced as Orava, further in view of Yamamoto et al. (United States Patent 7,098,950), hereinafter referenced as Yamamoto further in view of Kozuka et al. (United States Patent 6,163,024) hereinafter referenced as Kozuka.
- 27. **Regarding claim 3**, Orava and Takahashi, the combination discloses everything claimed as applied above (see claim 1), in addition, Orava and Takahashi fails to explicitly disclose that the apparatus wherein the power supply unit is formed on the single semiconductor substrate. However it would have been obvious to one of ordinary skill in the art at the time of the invention to include such a modification to the invention of Orava and Takahashi, as taught by Kozuka.
- 28. In a similar field of endeavor, Kozuka discloses a photoelectric transducer. In addition Kozuka discloses the apparatus wherein the power supply unit is formed on the single semiconductor substrate, as disclosed in claim 5.
- 29. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to include this modification to the invention of Orava and Takahashi for the purpose of reducing noise in the image pickup process.

Art Unit: 2625

Regarding claim 6, Orava and Takahashi, the combination discloses everything 30. claimed as applied above (see claim 4), in addition, Orava and Takahashi fails to explicitly disclose that the apparatus wherein the power supply unit is formed on the single semiconductor substrate. However it would have been obvious to one of ordinary skill in the art at the time of the invention to include such a modification to the invention of Orava and Takahashi, as taught by Kozuka.

- In a similar field of endeavor, Kozuka discloses a photoelectric transducer. In 31. addition Kozuka discloses the apparatus wherein the power supply unit is formed on the single semiconductor substrate, as disclosed in claim 5.
- Therefore it would have been obvious to one of ordinary skill in the art at the time 32. of the invention to include this modification to the invention of Orava and Takahashi for the purpose of reducing noise in the image pickup process.

Response to Arguments

The examiner acknowledges that the foreign priority date has been perfected and 33. overcomes the Takahashi reference. Therefore new grounds of rejection are set forth in the rejections of claims 1-6.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brendan N. McCommas whose telephone number is 571-270-3575. The examiner can normally be reached on M-F (alternate F off) 7:30 am -5 pm EST.

Application/Control Number: 10/661,553 Page 8

Art Unit: 2625

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jefferey Harold can be reached on 571-272-7519. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
